Video: MCR Safety ISO 17025 Certified Lab

MCR Safety | Jan 08, 2020

Video Highlights

Choosing the right PPE is vital to keeping workers safe, and the application of the product determines what certifications are necessary. But what happens when a product, for example a *glove*, states it is an A7 cut level, but is only an A4? Potentially serious injuries or even fatalities can result from this misinformation.

MCR performs certified methods of testing both their products and competitors in their ISO 17025 accredited lab. Watch in this video how cut level for ANSI standards is determined, the impact testing for standards on *safety glasses* is performed as well as abrasion and puncture level testing. MCR performs a plethora of tests that assure their customers of their quality and protection.
