VIDEO: Traditional vs. Split Point Drill Bits

Brought To You by Greenfield Industries | Jun 08, 2021

The right drill bit can help you work smarter and faster and even save you money if you know what features to look for. If you're drilling by hand, choose a drill with a split point. It drills on contact. You'll get a faster start and there's no walking and you're less likely to need a center punch to get started thanks to the split point's four cutting edges. Those extra edges cause the split point to drill rounder holes faster while generating less heat with less force. That means you're working faster and getting more holes per charge with your cordless drill.

Learn more about the advantages of spill point drills over traditional drills in the short video above.
