VIDEO: Drilling Through a Stack of 4 Different Steels With the New HPX Solid Carbide Drill

Brought To You by Kennametal | Oct 01, 2021

Kennametal's *HPX solid carbide drill* for steels features a straight cutting edge that reduces build-up and chipping on the cutting edge and margin land. The patented HPX point provides excellent self-centering capabilities, reduces thrust and enables precise center chip formation. Two margin lands provide stability and reduce friction. Up to three times higher cutting parameters, saving machining time and freeing up capacity. Ultra-high polished chip flutes reduce friction, improve chip evacuation and increase tool life. A continuous chip-flute cross-section reduces vibrations and reduces cutting edge chipping. MQL-ready. All shanks fulfill the DIN 6535 and 69090-03 requirements for minimum-quantity lubrication.

Watch it in action in the short video above.
