Healthcare Germ Hot Spots

Brought To You by Kimberly-Clark Professional | Nov 10, 2021

Placing hand sanitizer and signage in offices and common areas is a step in the right direction. But studies show it simply isn't enough to make a real impact. Objects that are touched by lots of people throughout the day – such as doorknobs, elevator buttons and handrails – should be cleaned and disinfected daily in order to help break the chain of germ transmission.

No matter which surfaces they may touch throughout their day, give your staff, patients and visitors peace of mind by providing proven cleaning and disinfecting solutions to help break the chain of germ transmission.

Cleaning these hot spot areas will help reduce germs in healthcare facilities:

- Doorknobs
- Elevator buttons
- Handrails

Cleaning removes germs, dirt, and impurities from surface objects. Cleaning works by using soap (or detergent) and water to physically remove germs from surfaces. This process does not necessarily kill germs, but by removing them, it lowers their numbers and the risk of spreading infection.

Disinfecting kills germs on surfaces or objects. Disinfecting works by using chemicals to kill germs on surfaces or objects.* This process does not necessarily clean dirty surfaces or remove germs, but by killing germs on a surface after cleaning, it can further lower the risk of spreading infection.

Hand Sanitizing kills germs on the body. The FDA regulates all topical antiseptic products such as hand sanitizers. These products are intended to be used when soap and water are not available and are not rinsed off with water.

Steps to make it easy to drive cleaning and hygiene habits:

Step 1

Clean the surface of commonly touched objects — use detergent or soap and water prior to disinfection.

Step 2

Disinfect the surface — use EPA-registered household disinfectants. Follow manufacturer's instructions for application and dwell time.

Did you know?

- In the span of 24 hours, the average adult touches 7,200 surfaces¹ and touches their face 552 times.²
- Cotton towels reduced disinfectant strength by up to 85%.³
- Keyboards harbored 8,900 bacteria⁴ per keyboard.
- Mobile phones harbored 6,300 bacteria⁵ per phone.
- 67% of soak buckets tested harbored bacteria.⁶

- The average desk has 400 times more bacteria⁷ than a toilet seat.
- 93% of towels sampled contained live bacteria⁶ including:
 - E. coli
 - Coliforms linked to feces
 - Pneumonia associated bacteria

For more information on how to make your facility truly exceptional – a place where everyone feels equipped and empowered to contribute to a more hygienic environment, visit Kimberly-Clark Professional's hand and surface cleaning page.
