VIDEO: ISCAR Modular Adaptations for Parting Adapters

Brought To You by ISCAR | Nov 01, 2024

The ISCAR Modular-Grip system is designed for high-performance grooving, turning, and parting operations. It features very rigid clamping, making it suitable for high feed rates and interrupted cuts. This system is known for providing maximum versatility, with a robust modular design that provides performance like integral (or non-modular) cutting tools. The Modular-Grip system is a preferred solution for multi-spindle lathes due to its ability to work close to the spindle without interference/collision issues. Watch it in action in the short video above (*music only, no transcript*).
