Nitrile Disposable Hand Protection Solutions

Brought To You by Ansell | Oct 31, 2018

Workers across many industries encounter oils, cleaning agents, paints and other liquids containing chemicals each and every day. Because they encounter a variety of risks and potential harmful exposures, they need durable gloves that offer tough barrier protection.

While ordinary disposable gloves may provide some protection in the event of accidental exposure, not all hold up to the level of everyday protection some workers need. For example, thin-film disposable gloves can be prone to rips, tears or pinhole defects, or simply wear down too fast, providing a level of protection that isn't enough for workers. Other options may not offer enough chemical splash protection.

To offer workers better protection against a variety of exposures while still providing a robust, comfortable glove, Ansell developed the **Microflex 93-850**, a disposable chemical-resistant glove that represents the ultimate barrier protection for workers in demanding environments. These soft, durable nitrile gloves provide 2x more chemical splash resistance than nitrile gloves of a similar weight. Microflex 93-850 offers the highest barrier quality and consistency and is the first disposable glove to achieve a low 0.40 AQL, meaning workers can expect fewer pinhole defects for a significantly reduced risk of harmful exposures. These innovative disposable gloves offer the strength and durability needed for chemical splash protection and a comfortable fit for longer wear times.

For more information on Microflex 93-850, visit **Ansell's website**.
